

Mobile Computing Project Requirements

Requirements:

- Fully working project using any mobile cross platform or any web platform.
- A report with details discussed in the following section.
- A small demo 3 min minimum showing all the features of the app and how it works.

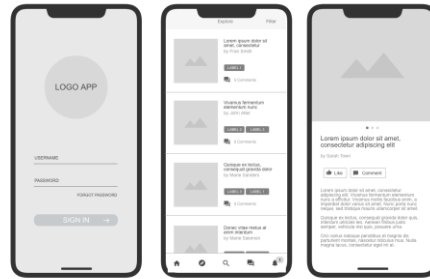

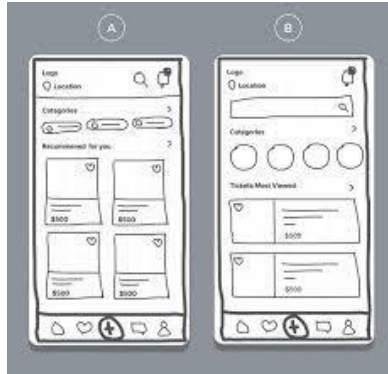

At these requirements should be uploaded on the project github link

Project Stages Requirements:

Each team should cover these stages in their project:

1. UX Phase

- a. Stage I: Research
 - Survey analysis (make sure to provide the questions and analysis on answers including percentages, conclusions, and gains and pain points)
 - Empathy map and personas (make sure to have a good template and sufficient details)
 - b. Stage II: Define a problem
 - Define the pain points and categorize them.
 - Make the 5Ws and H analysis then define problem statements using the template provided in the lab (*at least 3*).
 - c. Stage III: Ideate a solution
 - Define the goal statements using the template provided in the lab (*at least 3*).
 - List all the proposed solution, provide the selected solution and the reason of this selection.
 - Finally provide a brief about the problem statement, the selected solution, and specify all the features proposed for the app.
- N.B. you must compare with previous approaches if found, specifying their weak points and all features used to outperform them.*
- d. Stage IV
 - Create a low or high-fidelity wireframe for your app.
 - Make a site map that shows navigation between screens (can be combined with the wireframe).
 - UI Design is a plus.
 - AI design is forbidden for both designs.

2. Frontend

- You can select from these mobile cross platforms: React native and Flutter.
- You can select from these web platforms: React, angular, and Vue.js.
- Desktop applications are not allowed unless there is a mobile or web app.
- Make sure to have consistent color palette and fonts.
- Project files must be organized into folders for:
 - Components (*any defined custom components => if there are many categories make sub folders*)
 - Assets (images, fonts and colors)
 - Feel free to organize as you prefer but it must be professionally organized.
- Adding dark and light mode is a plus.

3. Backend

- You may use any database server suitable to your project.
- You can use any backend platform you prefer.
- Using AI models is a plus only if it is a feature not the core of the project (*no APIs*).

4. Features must be included in the project

- SignIn/Up forms (*make one custom component for both*).
- Navigation
- Notification
- The design must be responsive.
- The design should include dynamic content if applicable.

Report should include:

- Cover with team members, project title, FEHU logo, and course supervisors + contribution section.
- An intro about the project idea as a whole.
- Divide the report into these sections:

a. Section 01: UX Phase (Subsections: UX stage I, II, III, and IV)

N.B. follow instructions in UX phase requirements

N.B. for stage IV, provide the wireframe link for the app wireframes + a screenshot for screens with site map.

b. Section 02: Frontend

- Include design colors (primary, secondary, and neutral) and fonts as follows (*use your own visualization*).

Typography — assets/fonts/fonts.js

Four font roles are defined in assets/fonts/fonts.js to maintain a consistent visual hierarchy across the application.

Title	Header	Regular	Bold
Bebas Neue 32 – 48px Application name, splash screen, large display headings	Montserrat Bold 20 – 24px Screen titles, section headers, card titles	Montserrat Regular 14 – 16px Body text, descriptions, form labels	Montserrat SemiBold 14 – 18px Button labels, statistics, highlighted values

- Include a table that contains custom buttons including component name, style, where is used in the app and the component design.
- Include a table that contains any other custom component with the same details as the custom buttons.
- Feel free to add any other design aspect you have.
- Screenshots for UI design screens with names and brief description.
- Show some examples of your app responsiveness.

c. Section 03: Backend

- Put a snippet of the database records in different parts of the app.
- Explain your backend part including the dynamic content especially if the content is rendered from the database.

N.B. for sections 2 and 3, make a table that specifies all the technologies used for frontend and backend and place it properly in the report.

Project Rules

- Each team consists of a **maximum** of **5** students (*can be 6 for graduation project teams only*).
- All members should participate in all tasks.
- The project idea shouldn't be too simple, and it should cover all topics mentioned.
- During project discussion, every team member will be graded independently from other team members according to the discussion.
- The project code, report, and video must be uploaded on project repo github (deploying the project on a domain is a plus)
- Visualizing the project like what in these links and uploading on behance is a plus (besides report)
